

Catch AI — Import Guide for SiteGround

Put this page on your SiteGround-hosted WordPress site with Elementor (free — no Pro required).

BEFORE YOU START

- An active **SiteGround** plan with WordPress installed. (Not installed yet? *Site Tools* → *WordPress* → *Install & Manage*.)
- **Recommended:** test on a staging copy first — *Site Tools* → *WordPress* → *Staging* → *Create Staging Copy* (GrowBig / GoGeek plans), then Push to Live when happy.
- Have this kit's `catch-ai-elementor-template.json` and the `assets/` images ready on your computer.

IMPORT IN 6 STEPS

1. **Log into WordPress:** go to `https://YOURDOMAIN.com/wp-admin` and sign in. (This is your WordPress login — separate from your SiteGround Site Tools login.)
2. **Install Elementor (free):** *Plugins* → *Add New* → search **Elementor** → **Install Now** → **Activate**.
3. **Import the design:** *Templates* → *Saved Templates* → *Import Templates* → upload `catch-ai-template-IMPORT.zip` (or the `catch-ai-elementor-template.json` file) → **Import Now**. **Don't upload the whole kit zip — just this template file.**
4. **Create the page:** *Pages* → *Add New* → give it a title → **Edit with Elementor** → open the **folder / library** icon → **My Templates** → find **Catch AI — Home** → **Insert**.
5. **Set full-width layout:** Page Settings (gear, bottom-left) → **Page Layout** → **Elementor Canvas** → **Publish**. (Removes the theme header/footer — the design ships its own.)
6. **Global colors & fonts:** *Elementor* → *Site Settings* → *Global Colors / Global Fonts* (table below).

⚠ **Clear SiteGround cache after publishing.** SiteGround caches aggressively, so a new/updated page can look old or unstyled until you flush it:

- **SG Optimizer** plugin (in wp-admin) → *Caching* → *Purge SG Cache*, and
- *Site Tools* → *Speed* → *Caching* → *Dynamic Cache* → *Flush Cache*.
- Still looks broken? In **SG Optimizer** → **Frontend Optimization**, temporarily turn off "Minify CSS/JS" and "Combine CSS Files", then flush again.

No extra CSS setup: the sticky header and the hero's layered phone/photo are driven by a small CSS block that travels *inside* the template (an HTML widget in the hero), so a fresh import carries it automatically.

Make it the homepage (optional): *Settings* → *Reading* → *A static page* → *Homepage* → select this page. If your active theme is a block/FSE theme and the homepage re-adds a title/header, keep the page at its own URL or switch to the free **Hello Elementor** theme.

GLOBAL STYLES (FONTS: FRAUNCES HEADINGS · INTER BODY)

Primary — #181f2e

Text — #161b24

Secondary (muted) — #505561

Accent (lime buttons) — #d5f64e

Sky (hero bg) — #91d0fc

Mint (who-it's-for) — #d3edd3

Background — #fbfaf6

Ink 2 (dark section) — #0e141f

IMAGES (OPTIONAL)

- By default the images load from the preview URL and work immediately. To host them on your site: upload the 7 files in `assets/` to the **Media Library** and swap each Image widget's source, or bulk find-replace the base URL with *Better Search Replace*.

Full details, WP-CLI commands and the global-style applier script are in `README-ELEMENTOR.md` inside this kit. To keep a copy, use your browser's Print → Save as PDF.
