

Catch AI — WordPress / Elementor Import Guide

Everything to put this page on your own WordPress site. Works on free Elementor — no Pro required.

WHAT YOU NEED

1. A WordPress site (any host).
2. **Elementor** (free) — *Plugins* → *Add New* → search **Elementor** → Install → Activate.
3. The files in this kit (the `.json` template + the `assets/` images).

IMPORT IN 5 STEPS

1. **Import the design:** *Templates* → *Saved Templates* → *Import Templates* → upload `catch-ai-template-IMPORT.zip` (or the `catch-ai-elementor-template.json` file) → **Import Now**. **Don't upload the whole kit zip — just this template file.**
2. **Create a page:** *Pages* → *Add New* → give it a title → click **Edit with Elementor**.
3. **Insert the design:** in the editor, open the **folder / library** icon → **My Templates** → find **Catch AI — Home** → **Insert**.
4. **Set full-width layout:** Page Settings (gear, bottom-left) → **Page Layout** → **Elementor Canvas** → **Publish**. (This removes the theme header/footer — the design ships its own.)
5. **Set the global colors & fonts:** *Elementor* → *Site Settings* → *Global Colors / Global Fonts* using the table below.

No extra CSS setup: the sticky header and the hero's layered phone/photo are driven by a small CSS block that travels *inside* the template (an HTML widget in the hero), so a fresh import carries it automatically.

GLOBAL STYLES (FONTS: FRAUNCES HEADINGS · INTER BODY)

Primary — #181f2e

Text — #161b24

Secondary (muted) — #505561

Accent (lime buttons) — #d5f64e

Sky (hero bg) — #91d0fc

Mint (who-it's-for) — #d3edd3

Background — #fbfaf6

Ink 2 (dark section) — #0e141f

IMAGES (OPTIONAL — HOST THEM ON YOUR SITE)

1. Upload the 7 files in `assets/` to the **Media Library**.
2. Either swap each Image widget's source in Elementor, or bulk find-replace the base URL with a plugin like *Better Search Replace*. (By default they load from the preview URL and will work immediately.)

Full details, WP-CLI commands and the global-style applier script are in `README-ELEMENTOR.md` inside this kit. Tip: to save this as a PDF, use your browser's **Print** → **Save as PDF**.
